The Deep Hot Biosphere: The Myth of Fossil Fuels Thomas Gold

Suppose someone claimed that we are not running out of petroleum? Or that life on Earth began below the surface of our planet? Or that oil and gas are not "fossil fuels"? Or that if we find extraterrestrial life it is likely to be within, not on, other planets? You might expect to hear statements like these from an author of science fiction. But what if they came from a renowned physicist, an indisputably brilliant scientist who has been called "one of the world's most original minds"? In the *The Deep Hot Biosphere*, Thomas Gold sets forth truly controversial and astonishing theories about where oil and gas come from, and how they acquire their organic "signatures." The conclusions he reaches in this book might be at first difficult to believe, but they are supported by a growing body of evidence, and by the indisputable stature and seriousness Gold brings to any scientific enterprise. In this book we see a brilliant and boldly original thinker, increasingly a rarity in modern science, as he develops a revolutionary new view about the fundamental workings of our planet. Thomas Gold is a member of the National Academy of Sciences, a Fellow of the Royal Society, and an Emeritus Professor at Cornell University. Regarded as one of the most creative and wide-ranging scientists of his generation, he has taught at Cambridge University and Harvard, and for 20 years was the Director of the Cornell Center for Radiophysics and Space Research.
