## Dyskinesia: Research and Treatment (Psychopharmacology Series)

More than a quarter century has passed since the initial descriptions of tardive dyskinesia (Schonecker, 1957; Sigwald et al., 1959). The earliest epidemiologic study of this disorder was carried out in Roskilde, Denmark, by Uhrbrand and Faurbye (1960); the term tardive dyskinesia was first used a few years later in a subsequent paper (Faurbye et al., 1964). Despite 25 years of intensive investigative scrutiny, the syndrome persists, and approaches to its prevention and treatment continue to have limited efficacy. It is thus fitting to evaluate what has already been learned and consider future directions for research. . Tardive dyskinesia is generally dermed as an involuntary movement disorder, mainly involving the mouth, which attends long-term neuroleptic exposure. Beyond these simple facts, however, there has been relatively little consensus about this disorder. A desire to address the controversies associated with tardive dyskinesia prompted the organization of an international symposium at Kolløge, just outside Copenhagen. This publication comprises all 26 presentations.
